New optional Chipspreader released for CC224HF–CC334HF

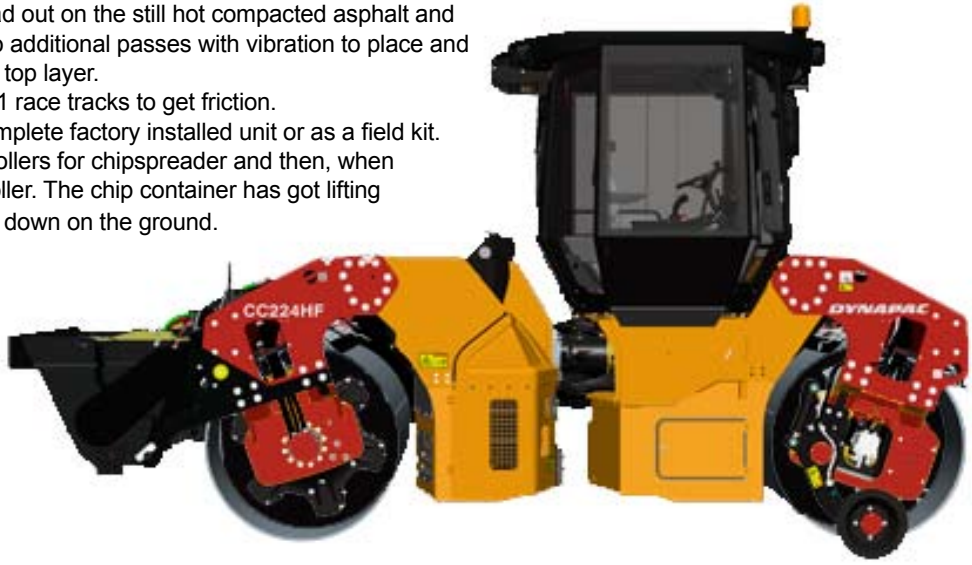
Dynapac Chipspreader

An optional chipspreader is now available for CC224HF, CC234HF, CC324HF and CC334HF.

Chipspreading is normally done when you want to have more friction than the top layer of asphalt can give. It can also be used to get a different colour on the surface to highlight bicycle lanes or sidewalks. Chips are spread out on the still hot compacted asphalt and pushed down in the asphalt with one or two additional passes with vibration to place and fixe the small stones into the surface of the top layer.

Chipspreading is often used on Formula 1 race tracks to get friction.

The chipspreader can be bought as a complete factory installed unit or as a field kit. There is also a possibility to prepare your rollers for chipspreader and then, when needed, mount the chip container on the roller. The chip container has got lifting eyelets and feet that makes it easy to put it down on the ground.



Easy to adjust

The amount of chips spread out per square meter can easily be adjusted on the run through the instrument display
